AB A central feature of the strategy for amide bond formation by prior thiol capture is an intramol. acyl transfer across a template that links the phenolic ester function of one peptide with an unsym. disulfide involving the side chain of the N-terminal cysteine residue of a second peptide. The structures of 4-hydroxy-6-mercaptodibenzofuran (I) and 4-hydroxy-6-mercaptophenoxythiin (II) were established by 1H NMR spectra of deuterated dibenzofuran and phenoxythiin derivs. On the basis of the criterion of effective molarity, a dibenzofuran template for intramol. acyl transfer is approx. 2 orders of magnitude more efficient than a phenoxythiin. An effective local concn. of ca 5 M and a Hammett .rho. value of 2.6 is obsd. for the intramol. acyl-transfer reaction of O-acyl dibenzofuran derivs. III (R = Ac, PhCH2O2C-Ala; R1 = H, Cl, Br, NO2; R2 = H, Cl; R3 = C-terminal group) to the corresponding N-acyl derivs. IV.

AB 1-Hydroxy[1]benzothieno[3,2-f]quinoline-3-carboxylic acids (I; R = e.g. 10-F, 8-Cl, 10-Br, 10-Me, 10-MeO, H, 8-MeO, 9-Me; R1 = e.g. H, 6-Cl, 5-MeO, 6-MeO; n = 0, 1, 2), useful as allergy inhibitors, are prepd. by reaction of 2-aminodibenzothiophenes with MeO2CC.tplbond.CCO2Me (II), cyclization of the resulting di-Me (dibenzothiophene-2-ylamino)fumarates and hydrolysis of the Me esters. Thus, reaction of II with 2-amino-8-fluorodibenzothiophene in MeOH at room temp. 16 h gives di-Me [(8-fluorodibenzothiophene-2-yl)amino]fumarate which on heating 5 min at 240.degree. in Ph2O gives the Me ester which is hydrolyzed to give I (R = 10-F, R1 = H, n = 0).

AB A durable antibacterial finish can be applied to cellulosic textiles by treatment with neomycin B, neomycin C, and salts of the neomycin complex. The yellowness or dullness which usually appears upon laundring of neomycin (I)-treated fabricscan be counteracted by application of optical bleaching agents. Agents applicable to cellulosic textiles are acyldiaminostilbenes, triazinyldiaminostilbenes, and acyldiaminodibenzothiophene dioxides, all of which contain sulfonic acid groups. Other brighteners which can be used are the all-purpose types, such as benzimadazoles and triazoles. The treating soln. preferably a pad bath, contg. both I and the bleaching agent can be prepd. without copptn. of the ingredients by addn. of an alk. agent, such as NaOH or KOH, to the soln. The fabric is padded through the bath and dried at 150-350.degree.F. The concn. of I m the soln. can be varied within wide limits depending upon the intended use. When applied by padding, the soln. should contain 0.001-1% by wt. of I, and the same concn. of bleaching agent, preferably 0.01-0.05% of the dry wt. of the material.

Substantivities were assigned numerical values and were detd. spectrophotometrically, titration with Ti salts, and colorimetrically. The following general rules were proposed for a bisazo dyestuff to be substantive: (1) the mol. wt. must be fairly high, (2) at least 2 auxochromes must be linked by a long chain of conjugated double bonds (at least 8), (3) free rotation of aromatic nuclei must be possible (thus dyestuffs from benzidine-2,2'-disulfonic acid are acid dyestuffs which dye wool), (4) usually the dyestuff should not be a deriv. of a p,p'-diamine, (5) neg. substituents decrease the substantivity.

AB The present invention relates to a method of prepg. N-(3,5-dichloropyridin- 4-yl)-4-difluoromethoxy-8-methanesulfonamido-dibenzo[b,d]furan-1- carboxamide and pharmaceutically acceptable salts thereof, such as its sodium salt, and novel intermediate compds. useful in the synthesis of the aforementioned compd. For example, reaction of 4-cyclopentyloxy-3- hydroxybenzaldehyde with 2-bromo-1-fluoro-4-nitrobenzene (70-77%), followed by cyclization, gave 4-cyclopentyloxy-8-nitro-1- formyldibenzofuran in 60-65% yield, which yielded the title compd. after 9 steps.

AB The present invention relates to novel tricyclic compds. (shown as I; variables defined below; e.g. 4-(4-methoxydibenzofuran-1-yl)-2-pyrrolidinone), analogs, tautomers, regioisomers, stereoisomers, enantiomers, diastereomers, polymorphs, pharmaceutically acceptable salts, appropriate oxides, pharmaceutically acceptable solvates and pharmaceutical compns. contg. them. The present invention also relates to phosphodiesterase type 4 (PDE4) inhibitors which down regulate or inhibit the prodn. of TNF-.alpha. and therefore are useful in the treatment of variety of allergic and inflammatory diseases including asthma and chronic obstructive pulmonary disease (COPD). Methods of prepn. are claimed and prepns. and/or characterization data for .apprx.60 examples of I are included. For example, 4-(4-methoxydibenzofuran-1-yl)-2-pyrrolidinone was prepd. by reductive cyclization of 3-(4-methoxydibenzofuran-1-yl)-4- nitrobutanoate (prepn. given) in iPrOH/DMF using 10 % Pd/C. For I: R1 is (un)substituted aryl, arylalkyl, heteroaryl, heterocyclyl, heterocyclylalkyl, or heteroarylalkyl; R2, R3, R4, R5 and R6 may be the same or different and = H or (un)substituted alkyl, alkenyl, alkynyl, cycloalkyl, cycloalkylalkyl, cycloalkenyl, aryl, arylalkyl, heteroaryl, heterocyclic group, heterocyclylalkyl, or heteroarylalkyl, -NR8R9, -C(O)R8, -C(O)OR8, -C(O)NR8R9, -S(O)mR8, -S(O)mNR8R9, nitro, -OH, cyano, formyl, acetyl, halogen, -OR8, -SR8, or a protecting group, or when R1 and R3, or R4 and R5 are ortho to each other then R1 and R3 together with the C atoms to which they are bound or R4 and R5 together with the C atoms to which they are bound may be joined to a form a (un)satd. cyclic ring, which may optionally include up to two heteroatoms = O, NRa or S; X is O, S(O)m and NR6; P is O or S; m = 0-2; addnl. details are given in the claims. IC50 values for inhibition of PDE4 by .apprx.60 examples of I are tabulated.

For example, N-(3,5-dichloropyrid-4-yl)-4-methoxy-8-aminodibenzo[b,f]furan-1- carboxamide (prepd. in six steps from isovanillin, 4-fluoronitrobenzene, and 4-amino-3,5-dichloropyridine) was coupled with methanesulfonyl chloride in THF and pyridine to give the sulfonamide II. The latter inhibited the PDE4-induced conversion of [3H] cAMP to the corresponding [3H] 5'-AMP with IC50 of 0.5058 nM. Thus, I and their pharmaceutical compns. are useful for the treatment of immune disorders, inflammatory conditions, allergic conditions, CNS diseases, and insulin resistant diabetes (no data).

AB In presence of an amine, the reaction of 3,7-dinitrodibenzobromolium bisulfate with DMSO gives 2-bromo-4,4'-dinitro-3'-dimethylsulfinio-2'- biphenolate (I). Crystal structure of I.1/2 C6H6, obtained by crystn. of I in benzene showes that I is a inner salt. The dihedral angle between two Ph rings is 117.3.degree.. The C(3)-O(3) bond distance(0.1254 nm) falls in the range from 0.119 .apprx. 0.121 nm (C=O double bond distance) to 0.133 .apprx. 0.136 nm (C-O single bond distance), which showes that there is a conjugation between O(3) and the Ph ring. Thermal decompn. of I gives both 2-bromo-2'-methoxy-3'-methylthio-4,4'-dinitro-biphenyl and 3,7-dinitro-4-methylthio-dibenzofurane. The reaction of I with hydrochloric acid gives corresponding sulfonium salt.

AB A central feature of the strategy for amide bond formation by prior thiol capture is an intramol. acyl transfer across a template that links the phenolic ester function of one peptide with an unsym. disulfide involving the side chain of the N-terminal cysteine residue of a second peptide. The structures of 4-hydroxy-6-mercaptodibenzofuran (I) and 4-hydroxy-6-mercaptophenoxythiin (II) were established by 1H NMR spectra of deuterated dibenzofuran and phenoxythiin derivs. On the basis of the criterion of effective molarity, a dibenzofuran template for intramol. acyl transfer is approx. 2 orders of magnitude more efficient than a phenoxythiin. An effective local concn. of ca 5 M and a Hammett .rho. value of 2.6 is obsd. for the intramol. acyl-transfer reaction of O-acyl dibenzofuran derivs. III (R = Ac, PhCH2O2C-Ala; R1 = H, Cl, Br, NO2; R2 = H, Cl; R3 = C-terminal group) to the corresponding N-acyl derivs. IV.

AB A durable antibacterial finish can be applied to cellulosic textiles by treatment with neomycin B, neomycin C, and salts of the neomycin complex. The yellowness or dullness which usually appears upon laundring of neomycin (I)-treated fabricscan be counteracted by application of optical bleaching agents. Agents applicable to cellulosic textiles are acyldiaminostilbenes, triazinyldiaminostilbenes, and acyldiaminodibenzothiophene dioxides, all of which contain sulfonic acid groups. Other brighteners which can be used are the all-purpose types, such as benzimadazoles and triazoles. The treating soln. preferably a pad bath, contg. both I and the bleaching agent can be prepd. without copptn. of the ingredients by addn. of an alk. agent, such as NaOH or KOH, to the soln. The fabric is padded through the bath,and dried at 150-350.degree.F. The concn. of I m the soln. can be varied within wide limits depending upon the intended use. When applied by padding, the soln. should contain 0.001-1% by wt. of I, and the same concn. of bleaching agent, preferably 0.01-0.05% of the dry wt. of the material.

Substantivities were assigned numerical values and were detd. spectrophotometrically, titration with Ti salts, and colorimetrically. The following general rules were proposed for a bisazo dyestuff to be substantive: (1) the mol. wt. must be fairly high, (2) at least 2 auxochromes must be linked by a long chain of conjugated double bonds (at least 8), (3) free rotation of aromatic nuclei must be possible (thus dyestuffs from benzidine-2,2'-disulfonic acid are acid dyestuffs which dye wool), (4) usually the dyestuff should not be a deriv. of a p,p'-diamine, (5) neg. substituents decrease the substantivity.

AB The present invention relates to a method of prepg. N-(3,5-dichloropyridin-4-yl)-4-difluoromethoxy-8-methanesulfonamido-dibenzo[b,d]furan-1-carboxamide

and pharmaceutically acceptable salts thereof, such as its sodium salt, and novel intermediate compds. useful in the synthesis of the aforementioned compd. For example, reaction of 4-cyclopentyloxy-3- hydroxybenzaldehyde with 2-bromo-1-fluoro-4-nitrobenzene (70-77%), followed by cyclization, gave 4-cyclopentyloxy-8-nitro-1- formyldibenzofuran in 60-65% yield, which yielded the title compd. after 9 steps.

For example, N-(3,5-dichloropyrid-4-yl)-4-methoxy-8-aminodibenzo[b,f]furan-1- carboxamide (prepd. in six steps from isovanillin, 4-fluoronitrobenzene, and 4-amino-3,5-dichloropyridine) was coupled with methanesulfonyl chloride in THF and pyridine to give the sulfonamide II. The latter inhibited the PDE4-induced conversion of [3H] cAMP to the corresponding

[3H] 5'-AMP with IC50 of 0.5058 nM. Thus, I and their pharmaceutical compns. are useful for the treatment of immune disorders, inflammatory conditions, allergic conditions, CNS diseases, and insulin resistant diabetes (no data).

AB Title compds. I [R1-3 = H, alk(en/yn)yl, cycloalkyl, etc.; P = O, S; n = 0-4; Ar = (un)substituted aryl, etc.; Y = carboxamido, aminosulfonyl, etc.] are prepd. For instance, 4-methoxydibenzofuran-1-carboxylic acid (prepn. given) is converted to the corresponding acid chloride (PhH, SOCl2, reflux, 4 h) and treated with 4-amino-3,5-dichloropyridine (DMF/THF, NaH, -10.degree.) to give II. II has IC50 = 0.8 nM for PDE4. I are useful for the treatment of inflammatory conditions, diseases of the central nervous and insulin resistant diabetes.
